

NigeriaForNigerians

A public record of government, problems, money, and evidence — connected so people can see it, check it, and act.

*The platform remembers.
Citizens decide.*

Transparency & Accountability

Primary track. Decisions, spending, and services made visible and open to scrutiny.

Safety, Reporting & Protection

Cross-track. Reports, guidance, and a path from evidence to support.

Proof of concept · September 2026

An invention sprint. A working record, ready to walk.

People cannot see the public life that shapes them.

Rights, services, and accountability depend on information people understand and trust. In Nigeria that information is scattered across gazettes, budgets, ministry sites, news, and rumour.

01 Who is responsible?

A stalled road, a dark street, a clinic that never opened — which office owns it.

02 Where did the money go?

What was allocated, what was released, and what was reported as spent.

03 What actually happened?

The promise, the project status, the evidence, and the official reply, in one place.

04 What can I do next?

Who to contact, what to keep, and how to make a report or a request.

The pieces are published. The thread is missing.

A budget names a figure.

Allocations sit in documents that few people can search, and fewer can connect to a place they know.

A signboard names a contractor.

A project appears, stalls, and leaves. The office, the payment, and the outcome drift apart.

A report names a delay.

News and social posts move on. The evidence, the response, and the history do not stay attached.

People are asked to hold institutions accountable with fragments.

One record, for everyone who has to use it.

Reading is public. An account is for taking part — submitting, responding, verifying — so the record stays open to anyone with a basic phone.

RESIDENTS

Search a place, follow a problem, learn a right, and see the office that owns it.

CONTRIBUTORS

Attach a photo or observation to an office, a problem, or a polling unit.

PRESS & CIVIL SOCIETY

Follow a sourced trail and pick up a documented case.

PUBLIC OFFICES

Publish a response that stays beside the evidence. The record keeps both.

A public memory of civic life.

NigeriaForNigerians connects government, places, people, problems, projects, money, evidence, and history as one graph. Finding a fact is the start of engaging the institution behind it.

Primary track: Transparency & Accountability. Reporting and protection use the same path, so a record of spending can also become a record of harm and a route to support.

Follow the thread.

●	Problem	Roads in Ikeja
●	Office	Works commissioner
●	Person	Office holder
●	Project	Allen Avenue spur
●	Money	Allocated and released
●	Contractor	Who was paid to build
●	Evidence	Photographs of the site
●	Report	What residents observed
●	Response	What the office said back

WORKED EXAMPLE IN THE PROTOTYPE

A stalled spur in Ikeja.

The demonstration follows one road from the problem to the office, the money, the contractor, the photographs, the citizen report, and the official reply. Amounts in this example are demonstration records, so the path can be walked in full.

Every page is a node. Leave it, and the relationship is still there.

ASK THE RECORD

“What happened to the abandoned road project in Ikeja?” The answer is marked AI Generated and cites the records underneath.

Seeing the record is the beginning.

The prototype turns a fact into a path: who to contact, what to keep, and where a case can go.

GUIDANCE

What should I do?

Plain language on rights, evidence to keep, the responsible office, and where to report — from a stalled project to a police encounter.

REPORT

See something.

Submit a photo, video, or note tied to an office, a problem, or a polling unit. It joins the public record.

FREEDOM OF INFORMATION

Ask the office, on the record.

Start a request against the institution already linked to the project, and keep the reply beside the question.

MAKE NIGERIA BETTER

A case can move.

Documented matters can be picked up by vetted legal organisations. The platform keeps the case. Courts decide guilt.

Every serious claim carries a trail.

Status is on the page.

Official record, reported, under review, disputed, AI Generated. A reader can see what kind of statement they are looking at.

Sources are required.

Money, claims, office-holder history, and evidence are refused when a source link is missing. The check runs before the record updates.

A person reviews first.

Public data lands in a staging area. A reviewer approves it before it enters the record. The crawler never writes the live record directly.

AI explains. It cites.

Ask retrieves from the graph, then summarises. Thin evidence is described as thin. The model does not invent a source or a verdict.

Sources in this proof of concept: Wikidata, Wikimedia Commons, the Budget Office of the Federation, curated government pages, and citizen submissions. Each carries a publisher and a link.

Useful where the connection is thin and the stakes are high.

TRUST

Who said it, when, what supports it, and whether the status later changed. History stays visible.

LOW BANDWIDTH

Maps have list fallbacks. The record is text, status, and links, readable when images are too heavy.

INCLUSION

Plain-language guidance, semantic pages, a skip link, and status a screen reader can name.

PRIVACY

Reading is open. Submitting requires sign-in. Guidance says to capture only what is lawful and safe.

LANGUAGES

English in this prototype. Translations can sit beside the graph — Hausa, Yoruba, Igbo, Pidgin — without rewriting relationships.

LOCAL REALITY

States, local governments, wards, offices, and laws are specific. Another community reuses the model with its own institutions.

Scale is another place on the same graph.

01

Nigeria is already the map.

States, local governments, and wards are first-class places. A new community is a new location with its offices, problems, and projects attached.

02

A new source is an adapter.

Places, government, people, budgets, and sector threads are crawled, staged, reviewed, then promoted. Nothing enters without a source check.

03

Another country keeps the thread.

Office, money, project, evidence, response. Institutions and laws change. The path from a problem to a next step stays the same.

Cross-track by design: bribery guidance, election observation, and the Make Nigeria Better scheme sit on the accountability record, so reporting leads somewhere.

Built with AI coding tools. Grounded in the public record.

Inside the product

- Ask retrieves matching records from the graph before any summary is written.
- Answers are labelled AI Generated and cite the pages they used.
- With no model key, the same question still returns the structured record.
- The model is instructed to point back to citations and to avoid verdicts.

How the prototype was made

- The civic idea — a public memory people can follow and act on — was set by the team.
- AI coding tools in Cursor implemented the domain graph, the public interface, ingestion, and the connected seed.
- Judges can run the journey locally: install, start, and open the Allen Avenue thread.
- The proof of concept is the argument: every documented path is navigable.

What changes when the thread is public.

A resident

Can name the office on a stalled project and see what was released, then choose a next step.

A journalist or organisation

Can cite a chain — problem, money, evidence, response — instead of a single post.

A public office

Can answer where the question already lives, and the answer remains part of the history.

A community

Can document a site so the evidence stays attached after the news cycle ends.

THIS PROOF OF CONCEPT

Shows that journey working end to end on a connected public graph, with citations, guidance, and a path to action.

WHAT FOLLOWS

Live budget feeds, verifier capacity, language layers, and confidential reporting for sensitive cases.

NIGERIAFORNIGERIANS

The platform remembers. Citizens decide.

A public record people can check, follow, and act on.
