

NigeriaForNigerians

A public record of government, problems, money, organisations, and evidence — connected so people can see it, follow it, and act.

*The platform remembers.
Citizens decide.*

Transparency & Accountability

Primary track. Decisions, spending, and services made visible and open to scrutiny.

Safety, Reporting & Protection

Cross-track. Reports, guidance, and a path from evidence to support.

Proof of concept · September 2026

An invention sprint. A working record, ready to walk.

Two everyday failures of civic memory.

The typical Nigerian moves through a day of visible wrongs and invisible money. Neither leaves a durable public trail.

SPOTLIGHT 01 • LAWLESSNESS

See it. Complain. Then nothing.

People experience and talk about blatant law violation — shakedowns, violence, official misconduct — but have no clear action item. The moment passes. The record does not form. Organisations that could prosecute never see the case in time.

SPOTLIGHT 02 • LOCAL MONEY

A CDA raises funds in the dark.

A community development association far from the capital collects dues and donations for local projects. The community stays vulnerable: there is no public record of who runs the CDA, how the money was raised, or how it was spent.

The pieces are published. The thread is missing.

A budget names a figure.

Allocations sit in documents that few people can search, and fewer can connect to a place or a community association they know.

A violation names no next step.

Complaints fill group chats. Evidence never becomes a matter. Legal NGOs never see the case while it is still fresh.

A report names a delay.

News and social posts move on. The evidence, the response, and the history do not stay attached.

People are asked to hold institutions accountable with fragments.

One record, for everyone who has to use it.

Reading is public. An account is for taking part — submitting, responding, verifying — so the record stays open to anyone with a basic phone.

RESIDENTS

Raise a case, follow a problem or matter by email, and see the office or organisation that owns the next step.

COMMUNITY ASSOCIATIONS

Publish who runs the CDA, how funds were raised, and how they were spent — so the community is not left guessing.

PRESS & CIVIL SOCIETY

Pick up a sourced trail or a Make Nigeria Better matter with evidence already attached.

PUBLIC OFFICES & LEGAL NGOS

Respond on the record, or prosecute a documented case until resolution. The history stays beside the outcome.

From a forgotten moment to a living case.

The product's job is to catch what usually disappears — and leave a path open when someone is ready to pursue it.

LEAST CASE

Immortalise the little record.

A photo, a spend line, a named officer, a budget envelope — the everyday fragments journalists and organisations often miss until they matter. The platform keeps them attached to place, people, and money.

BEST CASE

A matter reaches resolution.

Documented evidence becomes a Make Nigeria Better case. A vetted legal NGO picks it up and prosecutes until there is an outcome. The platform keeps the trail. Courts decide guilt.

Between those poles: follow a record by email, publish CDA people and spend, walk budget → allocation → project, and ask the graph what happened.

Follow the thread.

●	Problem	Roads in Ikeja
●	Office	Works commissioner
●	Person	Office holder
●	Project	Allen Avenue spur
●	Budget	Lagos capital envelope
●	Money	Allocated and released
●	Organisation	Contractor and spend lines
●	Evidence	Photographs of the site
●	Report	What residents observed
●	Response	What the office said back

WORKED EXAMPLE IN THE PROTOTYPE

A stalled spur in Ikeja.

The demonstration follows one road from the problem to the office, the budget, the allocation, the contractor, the photographs, the citizen report, and the official reply. Amounts in this example are demonstration records, so the path can be walked in full.

Parallel path: a Make Nigeria Better matter carries video evidence to a prosecuting NGO. Leave either page, and the relationship is still there.

ASK THE RECORD

“What happened to the abandoned road project in Ikeja?” The answer is marked AI Generated and cites the records underneath.

Seeing the record is the beginning.

The prototype turns a fact into a path: who to contact, what to keep, and where a case can go.

RAISE A CASE

From complaint to record.

Home CTA opens Make Nigeria Better. Capture video evidence of lawlessness so the moment becomes a matter other people can follow.

REPORT & FOI

Ask and attach.

Submit a photo or note tied to an office, problem, or polling unit. Start a Freedom of Information request against the institution already on the page.

ORGANISATIONS

Who runs it. What they spent.

CDAs, NGOs, contractors, and other actors publish people, income, spend, and project allocations — so local money is not invisible.

MAKE NIGERIA BETTER

A case can move.

Documented matters can be picked up by vetted legal organisations and prosecuted until resolution. The platform keeps the case. Courts decide guilt.

What judges can walk today.

Recent surfaces that make the two spotlights real in the seed, not only in the pitch.

Follow by email

Instant or weekly updates on organisations, people, problems, projects, and cases — with unsubscribe on every mail.

Organisation dossiers

Actor types (CDA, NGO, contractor...), people tiles, and clickable funding for income, spend, and project allocations.

Budget pages

Dedicated envelopes at /money/budgets — then allocations, releases, and projects on the same thread.

Make Nigeria Better

Hot-case tickets on the home deck; matters with evidence and prosecuting NGO assignment.

NGO browse

Organisations hub with thematic categories and spotlights so civil society is findable, not buried.

Ask the graph

Cited answers from the connected record, plus guidance that turns a fact into a next step.

Every serious claim carries a trail.

Status is on the page.

Official record, reported, under review, disputed, AI Generated. A reader can see what kind of statement they are looking at.

Sources are required.

Money, claims, office-holder history, and evidence are refused when a source link is missing. The check runs before the record updates.

A person reviews first.

Public data lands in a staging area. A reviewer approves it before it enters the record. The crawler never writes the live record directly.

AI explains. It cites.

Ask retrieves from the graph, then summarises. Thin evidence is described as thin. The model does not invent a source or a verdict.

Sources in this proof of concept: Wikidata, Wikimedia Commons, the Budget Office of the Federation, curated government pages, and citizen submissions. Each carries a publisher and a link.

Useful where the connection is thin and the stakes are high.

TRUST

Who said it, when, what supports it, and whether the status later changed. History stays visible.

LOW BANDWIDTH

Maps have list fallbacks. The record is text, status, and links, readable when images are too heavy.

INCLUSION

Plain-language guidance, semantic pages, a skip link, and status a screen reader can name.

PRIVACY

Reading is open. Submitting requires sign-in. Guidance says to capture only what is lawful and safe.

LANGUAGES

English in this prototype. Translations can sit beside the graph — Hausa, Yoruba, Igbo, Pidgin — without rewriting relationships.

LOCAL REALITY

States, local governments, wards, offices, and laws are specific. Another community reuses the model with its own institutions.

Scale is another place on the same graph.

01

Nigeria is already the map.

States, local governments, and wards are first-class places. A new community is a new location with its offices, problems, and projects attached.

02

A new source is an adapter.

Places, government, people, budgets, organisations, and sector threads are crawled, staged, reviewed, then promoted. Nothing enters without a source check.

03

Another country keeps the thread.

Office, money, project, evidence, response. Institutions and laws change. The path from a problem to a next step stays the same.

Cross-track by design: bribery guidance, election observation, and the Make Nigeria Better scheme sit on the accountability record, so reporting leads somewhere.

Built with AI coding tools. Grounded in the public record.

Inside the product

- Ask retrieves matching records from the graph before any summary is written.
- Answers are labelled AI Generated and cite the pages they used.
- With no model key, the same question still returns the structured record.
- The model is instructed to point back to citations and to avoid verdicts.

How the prototype was made

- The civic idea — a public memory people can follow and act on — was set by the team.
- AI coding tools in Cursor implemented the domain graph, the public interface, ingestion, and the connected seed.
- Judges can run the journey locally: install, start, and open the Allen Avenue thread.
- The proof of concept is the argument: every documented path is navigable.

What changes when the thread is public.

A resident who saw a violation

Has an action item: raise a case, attach evidence, and follow the matter instead of only complaining.

A CDA community

Can see who runs the association and how dues and donations were raised and spent.

A journalist or legal NGO

Can cite a chain — problem, money, evidence, matter — and pick up a case before it dies in a chat thread.

A public office

Can answer where the question already lives, and the answer remains part of the history.

THIS PROOF OF CONCEPT

Shows both poles working: little records that stay, and a path for a matter to be prosecuted until resolution.

WHAT FOLLOWS

Live budget feeds, verifier capacity, language layers, confidential reporting, and more organisations publishing spend.

The platform remembers. Citizens decide.

A public record people can check, follow, and act on — from a forgotten moment to a prosecuted case.
